

Unit 7.4 – Multiplying Probabilities “AND”

Probability of Two Independent Events →

If two events, A and B, are independent (one event does not affect the next event), then the probability of both events occurring is $P(A \text{ and } B) = P(A) \cdot P(B)$

Multiplying FRACTIONS!

Example 1: Complete each problem about finding the probability of independent events.

<p>a.) At a picnic, Julio reaches into an ice-filled cooler containing <u>8</u> regular soft drinks and <u>5</u> diet soft drinks. He removes a can, then <u>decides</u> he is not really thirsty, and <u>puts it back</u>. Find the <u>Independent</u> probability that Julio and the next person to reach into the cooler to get... 13 total drinks</p>	<p>b.) In a board game, three dice are rolled to determine the number of moves for the players. Find the probability of each given situation.</p> <p style="color: green; font-style: italic;">EACH DIE HAS #'s 1-6</p>
<p>i.) Make a tree diagram of the situation stated above.</p> <div style="text-align: center;"> <pre> graph TD Julio((Julio)) -- 8/13 --> R1((R)) Julio -- 5/13 --> D1((D)) R1 -- 8/13 --> R2((R)) R1 -- 5/13 --> D2((D)) D1 -- 8/13 --> R3((R)) D1 -- 5/13 --> D4((D)) </pre> </div>	<p>ii.) $P(6, 6, 5)$ $= \frac{1}{6} \cdot \frac{1}{6} \cdot \frac{1}{6} \approx .46$ $= \frac{1}{216}$.5%</p> <p>v.) $P(\text{three } 5\text{'s})$ $= \frac{1}{6} \cdot \frac{1}{6} \cdot \frac{1}{6}$ $= \frac{1}{216}$.5%</p>
<p>ii.) $P(R, R)$ $= \frac{8}{13} \cdot \frac{8}{13}$ $= \frac{64}{169}$ $=$ 37.9%</p>	<p>iii.) $P(D, R)$ $= \frac{5}{13} \cdot \frac{8}{13}$ $= \frac{40}{169}$ $=$ 23.7%</p>
<p>iv.) $P(D, D)$ $= \frac{5}{13} \cdot \frac{5}{13}$ $= \frac{25}{169}$ $=$ 14.8%</p>	<p>vi.) $P(\text{any } \#, \text{ any } \#, \text{ not } 2)$ $= \frac{6}{6} \cdot \frac{6}{6} \cdot \frac{5}{6}$ $= \frac{180}{216}$ 83.3%</p>
<p>iii.) $P(\text{no } 3\text{'s})$ $= \frac{5}{6} \cdot \frac{5}{6} \cdot \frac{5}{6}$ $= \frac{125}{216}$ 57.9%</p>	<p>vii.) $P(1, 2, 3, \text{ not } 4)$ 4 dice; only rolled 3! 0%</p>
<p>iv.) $P(5, 6, 7)$ $= \frac{1}{6} \cdot \frac{1}{6} \cdot \frac{0}{6}$ $= 0\%$ 0%</p>	<p>viii.) $P(\text{not } 3, \text{ not } 4, 1)$ $= \frac{5}{6} \cdot \frac{5}{6} \cdot \frac{1}{6}$ $= \frac{25}{216}$ 11.6%</p>

Example 2: Using the given spinner to complete each problem.

<p>a.) Sketch a diagram showing all the possibilities. Spin two times.</p> <div style="text-align: center;"> <pre> graph TD Spin1((Spin 1)) -- 1/3 --> R1((R)) Spin1 -- 1/3 --> B1((B)) Spin1 -- 1/3 --> Y1((Y)) R1 -- 1/3 --> R2((R)) R1 -- 1/3 --> B2((B)) R1 -- 1/3 --> Y2((Y)) B1 -- 1/3 --> R3((R)) B1 -- 1/3 --> B3((B)) B1 -- 1/3 --> Y3((Y)) Y1 -- 1/3 --> R4((R)) Y1 -- 1/3 --> B4((B)) Y1 -- 1/3 --> Y4((Y)) </pre> </div>	<p>b.) $P(\text{red, blue})$ $= \frac{1}{3} \cdot \frac{1}{3}$ $= \frac{1}{9}$ $=$ 11.1%</p>	<p>c.) $P(\text{yellow, not red})$ $= \frac{1}{3} \cdot \frac{2}{3}$ $= \frac{2}{9}$ $=$ 22.2%</p>
--	--	--

Probability of Two Dependent Events → aka → Conditional Probability

If two events, A and B, are dependent (one event affects the next event),

then the probability of both events occurring is $P(A \text{ and } B) = P(A) \cdot P(B \text{ following } A)$

Example 3: Complete each problem about finding the probability of dependent events.

a.) The host of a game show is drawing chips from a bag to determine the prizes for which contestants will play. Of the 10 chips in the bag, 6 show TELEVISION, 3 show VACATION, and 1 shows CAR. If the host draws the chips at random and does <u>not replace them</u> , then find each probability. <i>dependent 10 total chips</i>		b.) Three cards are drawn from a standard deck of cards <u>without replacement</u> . Find each probability. <i>dependent!</i> D-diamond H-heart C-clubs S-spades	
i.) $P(V, \text{ then } C)$ $= \frac{3}{10} \cdot \frac{1}{9}$ $= \frac{3}{90}$ 3.3%	ii.) $P(T, \text{ then } T)$ $= \frac{6}{10} \cdot \frac{5}{9}$ $= \frac{30}{90}$ 33.3%	$P(C, \text{ then } B)$ $= \frac{1}{10} \cdot \frac{0}{9}$ <i>no B chip!</i> $= \frac{0}{90}$ 0%	i.) $P(D, C, D)$ $= \frac{13}{52} \cdot \frac{13}{51} \cdot \frac{12}{50}$ $= \frac{13}{850}$ 1.5%
		ii.) $P(H, H, H)$ $= \frac{13}{52} \cdot \frac{12}{51} \cdot \frac{11}{50}$ $= \frac{11}{850}$ 1.3%	

Example 4: Determine whether the events are independent or dependent.

Then find the probability.

a.) Yana has 7 blue pens, 3 black pens, and 2 red pens in his desk drawer. If he selects three pens at random with no replacement, what is the probability that he will first select a blue pen, then a black pen, and then a red pen?

Dependent (no replacement)

12 total pens

$$P(\text{Blue, Black, Red}) = \frac{7}{12} \cdot \frac{3}{11} \cdot \frac{2}{10}$$

$$= \frac{7}{220}$$

3.2%

b.) A black die and a white die are rolled. What is the probability that a 3 shows on the black die and a 5 shows on the white die?

Independent (two different dice)

6 #'s on each die

$$P(\text{Black die } \#3, \text{ white die } \#5)$$

$$= \frac{1}{6} \cdot \frac{1}{6}$$

$$= \frac{1}{36}$$

2.8%

c.) Tami, Sonia, Michael, and Roger are the four candidates for student council president.

If their names are placed in random order on the ballot, what is the probability that Michael's name will be first on the ballot followed by Sonia's name second?

Dependent (candidates)

4 total people

$$P(\text{Michael, then Sonia})$$

$$= \frac{1}{4} \cdot \frac{1}{3} = \frac{1}{12}$$

8.3%

d.) Joe's wallet contains three \$1 bills, four \$5 bills, and two \$10 bills. If he selects three bills in succession, find the probability of selecting a \$10 bill, then a \$5 bill, and then a \$1 bill if the bills are not replaced.

Dependent (not replaced)

9 total bills (not \$ value)

$$P(\$10, \$5, \$1)$$

$$= \frac{2}{9} \cdot \frac{4}{8} \cdot \frac{3}{7} \rightarrow \frac{1}{21}$$

4.8%

e.) A bag contains 6 green marbles and 8 yellow marbles. Carlos randomly selects one, puts it back, and then randomly selects another. What is the probability that Carlos selected one of each marble?

Independent (puts back)

14 total marbles

$$P(G, Y)$$

$$= \frac{6}{14} \cdot \frac{8}{14} \Rightarrow \frac{48}{196}$$

24.5%
